## **CLAIMS**

What is claimed is:

1. A method of generating common intermediate language code comprising:

writing first JAVA<sup>TM</sup> language source code that comprises a definition of a generic class usable in a framework;

generating an instance of the generic class; and compiling the instance of the generic class into common intermediate language code executable by a runtime engine.

- 2. A method as recited in claim 1 further comprising storing the source code in a class library of the framework.
- 3. A method as recited in claim 1 further comprising receiving second source code referencing the generic class.
- 4. A method as recited in claim 1 further comprising: receiving second source code referencing the generic class; and parsing the second source code into a parse tree representing the second source code.
- 5. A method as recited in claim 1 further comprising parsing the portion of JAVA<sup>TM</sup> source code into a parse tree representing the source code.

Lee & Hayes, PLLC 28

6. A method as recited in claim 1 wherein writing first JAVA<sup>TM</sup> language source code comprises defining at least one parameter associated with the generic class.

- 7. A method as recited in claim 6 wherein the at least one parameter is an unconstrained type.
- 8. A method as recited in claim 1 further comprising declaring an instance of the generic class in second JAVA<sup>TM</sup> source code.
- 9. A method as recited in claim 8 wherein declaring an instance of the generic class comprises specifying a type from a plurality of allowable types associated with the generic class.
- 10. A method as recited in claim 9 wherein the specified type is another generic class.
- 11. A method as recited in claim 1 wherein the generic class comprises one of:
  - a Queue class;
  - a Dictionary class; and
  - a Stack class.

12. A method of using a generic class comprising:

adapting existing JAVA<sup>TM</sup> source code to include a declaration of a first generic class provided by a software package having a class definition of the first generic class; and

compiling the adapted JAVA<sup>TM</sup> source code with the class definition to generate common intermediate language code.

- 13. A method as recited in claim 12 wherein the adapting comprises: editing the existing JAVA<sup>TM</sup> source code with a Visual J# .NET<sup>TM</sup> application in a .NET<sup>TM</sup> Framework.
- 14. A method as recited in claim 12 wherein the class definition defines at least one parameter of the generic class.
- 15. A method as recited in claim 12 wherein compiling comprises:

  validating a specified type of the generic class according to the class definition.
- 16. A method as recited in claim 12 wherein the adapting comprises nesting a second generic class in the declaration of the first generic class.

17. A system for authoring source code comprising:

a class library having a generic class definition; and

a means for receiving a declaration of an instance of the generic class in JAVA<sup>TM</sup> language source code.

- 18. A system as recited in claim 17 wherein the means for receiving comprises a computer-readable medium having stored thereon a VISUAL J# .NET<sup>TM</sup> application.
- 19. A system as recited in claim 17 further comprising a common intermediate language importer operable to associate the generic class declaration in the JAVA<sup>TM</sup> language source code to the generic class definition.
- 20. A system as recited in claim 17 further comprising a semantic analyzer operable to validate the generic class declaration in the JAVA<sup>TM</sup> language source code according to the generic class definition.
- 21. A system as recited in claim 17 further comprising a code generator operable to generate metadata descriptive of the generic class and further operable to generate common intermediate language code representative of the generic class.
- 22. A system as recited in claim 21 further comprising a runtime engine operable to translate the common intermediate language into machine-specific binary executable by a computer associated with the runtime engine.

23. A computer-readable medium having stored thereon microprocessor-executable instructions for performing a method comprising:

receiving input representing a generic class definition in a JAVA<sup>TM</sup> language;

receiving source code that references the generic class; and compiling the source code with an instance of the generic class into common intermediate language code executable by a runtime engine.

- 24. A computer-readable medium as recited in claim 23 wherein the method further comprises storing the generic class definition in a framework class library.
- 25. A computer-readable medium as recited in claim 23 wherein the source code comprises JAVA<sup>TM</sup> language source code.
- 26. A computer-readable medium as recited in claim 23 wherein the method further comprises generating metadata describing the generic class.
- 27. A computer-readable medium as recited in claim 23 wherein the generic class definition comprises a generic class name and two angular brackets around one or more parametric types.
- 28. A computer-readable medium as recited in claim 23 wherein the method further comprises compiling the generic class definition into common intermediate language code.
